

### **Bug Colony Substrate Changing Procedure**

- Clear all clean skeletons out of the bin
- Remove any half eaten specimens into the new bin with clean bedding
- Take a couple of fresh specimens and put them into glass jars
- Spritz a little water into the jars and place them in the old bin
- Wait for the bugs to come cover the new carcasses
- Pull out the new carcasses and gently shake off the bugs into the new container and replace the clean carcass back into the jar in the old bin
- Repeat with multiple carcasses until you have managed to collect most of the bugs and moved them to the new bin
- Dispose of the empty bedding in the garbage bin in the back of the collections
